

Phases 4 project restaurant

This project is a front-end only project that has three pages. I used html, bootstrap, css, and javascript within my three html files. I also utilized some images of random food found on google for design. All pages contain a nav bar with a logo and links to the other pages and a footer with my name and generic information.

My first page is the landing page which is index.html. This is where the user would start as it is the home page. This page's unique features are its carousel with three photos of food and its CTA button which takes the user to the food menu. This page is very basic.

The next page menu.html is where the CTA button takes the user. This page utilizes the bootstrap grid to organize the menu items which have a photo, name, and price.

The last page is the contact page called form.html. This page has three input fields for name, email, and comment which theoretically would be sent to the restaurant. The submit button uses a simple javascript function to confirm the submission of the information. The fields are required and cannot be blank when submitted as the user will be prompted to input text.
