Phase 4 Budget Planner

This project is a front-end only project that has two pages. I used html, bootstrap, css, and javascript within my two html files. The pages contain a nav bar with links to the other page. The table in this project is formed by JavaScript and json.

My first page is the Project Manager page which is ProductManager.html. This page allows the user to add a product, delete a product from the product table. The user is also able to edit the project name, manager, and client name to an existing product in the table. The user is able to fill the form with the existing information by selecting the ID of the product and pressing 'fill'. The cost cannot be edited on this page as that is for the financial manager.

My second page is the Finance Manager page which is FinanceView.html. This page is similar to the Project Manager page as it has the same table. However, this page has the budget editable text where the user can change the budget. Also, next to the table is an edit form to edit the project cost which the product manager could not do. This has a field for ID to fill the cost field of the existing product.
